REST API for key-value storage

Need to design and implement REST api for key-value storage. So you should be able do any operations you could do with key-value storage via REST api:

- Set value
- Get value
- Delete value
- Bulk operations(optional)

Requirements:

We would like to see what does it mean "production quality" code for you. We don't have strong time expectations but it would be great if you can do it fast(for example: by one or two evenings).

- python
- any libs and frameworks you want
- tests
- docker + docker-compose to be able run it easily
- README with description and instructions how it could be run
- documenting code would be a plus
- Github repository with commits that show progress of development if it's possible
